## CHAPTER-

## 01PROPERTIESOFFLUID

## INTRODUCTION

Fluidmechanicsisthe branchof engineering science whichdeals withthestudyoffluidsanditspropertiesandforceswhich cause motion of different layer.

## FLUID:

Fluidisasubstanceasaliquidor gasi.e.capableofflowing and yields easily through small external pressure.

Ex-water,air,petrol,etc

## PROPERTIESOFFLUID:

1) Density/MassDensity
$>$ Density or mass density of a fluid is defined as the ratio of massofafluidto itsvolume. Thusmassperunitvolumeofa fluid is called density.
$>$ Itisdenotedby $\rho$.
Mathematically:
> Massdensity $(\rho)=$ massoffluid/volumeoffluid
> Units-gm $/ \mathrm{cm}^{3}, \mathrm{~kg} / \mathrm{m}^{3}, \mathrm{gm} / \mathrm{cc}$
$>$ Thevalueofdensityof $1000 \mathrm{~kg} / \mathrm{m}^{3}$ or $1 \mathrm{gm} / \mathrm{cm}^{3}$
$>$ Densityofwaterismaximumat $4{ }^{\circ} \mathrm{C}$

## 2) SpecificWeightorWeightdensity:

> Specificweightor weightdensityofa fluidofafluidis definedas theratiobetweenweight ofthefluid toits volume.
$>$ Itisdenotedby w.
> Mathematically,
$>$ SpecificWeight=weightofthefluid/volumeofthe fluid =(massoffluid $\times$ accelerationdueto gravity)/
volume of the fluid

$$
w=\rho \times g
$$

$>$ Units- $\mathrm{N} / \mathrm{m}^{3}, \mathrm{kgf} / \mathrm{m}^{3}$,dyne/cm ${ }^{3}$
$>$ Weightdensityofwateris $9810 \mathrm{~N} / \mathrm{m}^{3}$

## 3) Specificgravity:

$>$ It is defined as the ratio between density or weight densityofafluidto thedensityorweightdensityofa standard fluid.
> Itisalsoknownasrelativedensity.
$>$ ItisdenotedbyS.
> Mathematically, specificgravity=(densityorweightdensityofafluid)/ (density or weight density of standard fluid)
Forgasstandardfluidisair,forliquidstandardfluidiswater.
4) SPECIFICVOLUME:
$>$ Specificvolumeofafluidis defined asthevolumeoccupiedby a unit mass or volume per unit mass of a fluid is called specific volume.
Specificvolume=volumeoffluid/massoffluid

$$
\begin{aligned}
& =1 /(\text { massoffluid/volume }) \\
& =1 / \rho
\end{aligned}
$$

$>$ Itisreciprocalofdensity.Itisexpressedinm ${ }^{3} / \mathrm{kg}$

## PROBLEM-01

Calculate thespecificgravity, densityandweightdensityofone litre of a liquid which weighs 7N.

## Datagiven

.Volume $=1$ litre $=0.001 \mathrm{~m}^{3}$
Weight=7N To
be found
Specificgravity(S)=?
Density ( $\rho$ )=?
Weightdensity $(\mathrm{w})=$ ?

## Calculation

1) Specificweight(w)= weight/volume

$$
=7 / 0.001=7000 \mathrm{~N} / \mathrm{m}^{3}
$$

2) Density $(\rho)=$ weightdensity/accelerationduegravity

$$
=7000 / 9.81=713.5 \mathrm{~kg} / \mathrm{m}^{3}
$$

3) Specificgravity(S)=densityofliquid/densityofwater

$$
=713.5 / 1000=0.713 \text { (ans) }
$$

## PROBLEM-02

Calculate thedensity,specific weightandweightofonelitreof petrol of specific gravity=0.7.

## Datagiven

Specificgravity(s)=0.7
Volume $=1$ litre $=0.001 \mathrm{~m}^{3} \underline{\underline{0}}$
be found

Density $(\rho)=$ ?
SpecificWeight(w)=?
Weight ( w )=?

## Calculation

Weknowspecificgravity=densityofliquid/densityofstandardfluid
Hence density of liquid $=s p$. Gravity $\times$ density of standard fluid

$$
=0.7 \times 1000=700 \mathrm{~kg} / \mathrm{m}^{3}
$$

Specificweight(w)=density $\times$ accelerationduetogravity

$$
=700 \times 9.81=6867 \mathrm{~N} / \mathrm{m}^{3}
$$

Weknowweightdensity=weight/volume
$\therefore$ weight=weightdensity×volume

$$
=6867 \times 0.001=6.867 \mathrm{~N}
$$

## VISCOSITY:

$>$ Viscosity is defined as the property of a fluid which offers resistance tothemovementofonelayeroveranotheradjacent layer.
> When two layer of a fluid a distance dy apart move one another atdifferentvelocities,sayuandu+du asshowninfig.below, the viscosity together with relative velocity causes a shear stress acting between the fluid layers.
$>$ The top layer causes a shear stress on the adjacent bottom layer andthebottomlayercausesashearstressonadjacenttop layer, this shear stress is directly proportional to the rate of change of velocity with respect to y .
$>$ Mathematically, $\quad \tau \alpha(d u / d y)$

$$
\tau=\mu(d u / d y)
$$

where, $\mu=$ constantofproportionalityisknownascoefficientof viscosityordynamicviscosity.
(du/dy)=iscalledvelocitygradient orrate ofchangeofvelocity $\mu=$

$$
\tau /(d u / d y)
$$

units- NS $/ \mathrm{M}^{2}$, DyneS $/ \mathrm{Cm}^{2}$, $\mathrm{KgFS} / \mathrm{M}^{2}$
One Dyne $\mathrm{S} / \mathrm{Cm}^{2}$ is called one poise.

### 1.3KINEMATICVISCOSITY:

Itis theratiobetweendynamic viscosityto thedensityofthe fluid. It is denoted by v .

Mathematically,
Kinematicviscosity=Dynamicviscosity/Fluidmass density

$$
v=\mu / \rho
$$

units:-m²/s, $\mathrm{cm}^{2} / \mathrm{s}$
$1 \mathrm{~cm}^{2} / \mathrm{s}=1$ stoke

### 1.3SURFACETENSION

$>$ It is defined as a tensile force acting on the surface of a liquid incontact withagas orom thesurface betweentwo immiscible liquids such that the contact surface behaves like a stretched membrane.
$>$ It is the property of a fluid by virtue of which its free surfacebehaves likea stretchedmembrane andsupports comparatively heavier object placed over it.
Units:N/m
$>$ Surfacetensionofliquiddroplet, $P=4 \sigma / d$
> Surfacetensionofahollowbubble, $\mathrm{P}=8 \mathrm{\sigma} / \mathrm{d}$
> Surfacetensionof aliquidjet, $\mathrm{P}=2 \mathrm{\sigma} / \mathrm{d}$

### 1.3 CAPILLARITY:

$>$ it is defined as a phenomenon of rise or fall of a liquid surfacein asmalltuberelativetothe adjacent general level of liquid when the tube is held vertically.
$>$ Therisein liquid leveliscalledcapillaryrise,andthefall of liquid level is called capillary fall.
$>$ Capillaryrise, $\Delta \mathrm{h}=4 \sigma \cos \theta / \mathrm{d} \rho \mathrm{g}$ $\Theta=0^{\circ}$ in case of water
> Capillaryfall, $\Delta \mathrm{h}=4 \sigma \cos \theta / \mathrm{d} \rho \mathrm{g}$ $\Theta=128^{\circ}$ in case of mercury
> Capillaryriseoccurincaseofwaterandcapillaryfall occur in case of mercury.

## TYPESOFFLUID

## (i) Idealfluid:

Thefluidwhichis incompressibleand noviscosityis called idealfluid.Itisanimaginaryfluidasallexistingfluidshave some viscosity.

## (ii) Realfluid:

Afluidthatpossessesviscosityiscalledrealfluid.Inactual practice all the fluids are real fluid.

## (iii) Newtonianfluid:

Thefluidwhichobeynewtonslawofviscosityiscalled
Newtonian fluid.
(iv) Non-Newtonianfluid:

## SHORTQUESTIONS

1) Definemassdensityandspecificgravity?(2019-S)
$>$ Ans-Densityormassdensity ofafluidisdefinedastheratio of mass of a fluid to its volume. Thus mass per unit volume of a fluid is called density.
$>$ Itisdenotedby $\rho$.

## CHAPTER-02

## FLUIDPRESSUREANDITSMEASUREMENT

## INTRODUCTION

$>$ When a fluid contained in a vessel it exerts force on each side and bottom of the vessel. This force per unit area of a fluid is called fluid pressure or simply pressure.
> Thusforceperunitarea ofafluidiscalledfluidpressure.
> Instrumentusedformeasurementofpressureisbarometer.
> Units-N/M ${ }^{2}$, $\mathrm{N} / \mathrm{CM}^{2}$, Dyne/CM ${ }^{2}$, pascal, KPa,etc
$>$ Itsbiggerunitisbar
Ibar $=10^{5} \mathrm{~N} / \mathrm{M}^{2}$ or $10^{5}$ Pascal
Pressureatapointofheighthfromfreesurfaceofliquid -
$P=\rho g h$
$h=P / \rho g$, whereP/ $\rho g$ iscalledpressurehead

## PASCAL'SLAW:

Itstatesthatthepressureorintensityofpressureatapointin a static fluid is equal in all direction.

$$
P_{x}=P_{y}=P_{z}
$$

Where $P_{X}=$ pressure fluid in $X$ direction $P_{Y}=$ pressurefluidinYdirection $\mathrm{P}_{\mathrm{z}}=$ pressurefluidin $Z$ direction

## Atmosphericpressure,Absolute,GaugeandVacuum

## Pressure

Usually,pressureonafluidisexpressedintwodifferentwaysby assuming two different datums in two different systems.
> Inonesystem,theabsolutezeroorcompletevacuumisadopted the datum where as in other system, the pressure above the atmospheric pressure is considered.

## Atmosphericpressure( $\mathrm{P}_{\mathrm{atm}}$ )

Thepressureexertedbytheenvelopeofairsurroundingthe earth's surface is known as atmospheric pressure.
$P_{\text {atm }}=W_{\text {hg }} h$
Wherew ${ }_{\mathrm{hg}}=$ weightdensityorspecificweightoffluid $\mathrm{h}=^{\mathrm{h}}$. height of the fluid in barometric tube.

## AbsolutePressure( $\mathrm{P}_{\mathrm{ab}}$ )

The pressure which is measured with reference to absolute vacuum pressure or zero pressure is called absolute pressure.

## GaugePressure( $\mathrm{P}_{\mathrm{ga}}$ )

> Thepressurewhichismeasuredbytakingtheatmosphericpressure as datum is called gauge pressure.
$>$ This is the pressure which is measured by a pressure measuring instrument.
> Theatmosphericpressureistakenaszero.

## VacuumPressure(Pvac)

$>$ The pressure which is below the atmospheric pressure is called vacuum pressure.
> Itisalsocalledsuctionpressureornegativegaugepressure.

Absolutepressure $=$ AtmosphericPressure + GaugePressure $\mathrm{P}_{\mathrm{abs}}=$

$$
\begin{aligned}
& \mathrm{P}_{\text {atm }}+\mathrm{P}_{\text {gauge }} \\
& \mathrm{P}_{\text {abs }}=\mathrm{P}_{\text {atm }}-\mathrm{P}_{\text {vacuum }}
\end{aligned}
$$

## Problem-1

The reading of a barometer is found to be 760 mm of Hg . What should be the atmospheric pressure in $\mathrm{N} / \mathrm{M}^{2}$ and in terms of water if sp. Gravity of Hg is 13.6 ?

## Datagiven

$\mathrm{h}_{1}=760 \mathrm{mmofHg} \mathrm{s}_{1}$
$=13.6$
weknowdensity $\left(\rho_{1}\right)=13600 \mathrm{~kg} / \mathrm{m}^{3}$ we
know atmospheric pressure
$P_{\text {atm }}=\rho_{1} \mathrm{gh}_{1}=13600 \times 9.81 \times 0.760=101435.4 \mathrm{~N} / \mathrm{m}^{2}$
Leth ${ }_{2}$ betheatmosphericpressurein termsofheadofwater We know the relationship $s_{1} h_{1}=s_{2} h_{2}$
$13.6 \times 760=1 \times h_{2}$
$h_{2}=10.34$ mofwater

## PROBLEM-02

Ahydraulicpresshasaramof30cmdiameterandaplungerof
4.5 cm diameter. Find the weight lifted by the hydraulic presswhen the force applied at the plunger is 500 N .
Solution
Dia. of ram $\quad D=30 \mathrm{~cm}=0.3 \mathrm{~m}$
Dia.ofplungerd $=4.5 \mathrm{~cm}=0.045 \mathrm{~m}$
Force on plunger, $F=500 \mathrm{~N}$
Areaofram $(A)=\pi / 4 D^{2}=\pi / 4 \times 0.3^{2}=0.07068 \mathrm{~m}^{2}$
Areaofplunger $(a)=\pi / 4 d^{2}=\pi / 4 \times 0.045^{2}=0.00159 \mathrm{~m}^{2}$
Pressureintensityduetoplunger=forceontheplunger/areaof
Plunger= $\mathrm{F} / \mathrm{a}=500 / 0.00159=314465.4 \mathrm{~N} / \mathrm{m}^{2}$
Duetopascal'slawtheintensityofpressurewillbeequally
transmitted in all direction.
Hencethepressureintensity attheram $=314465.4 \mathrm{~N} / \mathrm{m}^{2}$ But
pressure intensity at ram = weight/area of ram

$$
=\mathrm{W} / \mathrm{A}=\mathrm{W} / 0.07068 \mathrm{~N} / \mathrm{m}^{2}
$$

Weight=314465.4×0.07068=22222N=22.222KN.ans

## PRESSUREMEASURINGINSTRUMENT:

Thepressureoffluidismeasuredbythefollowingdevices-
(1) Manometer
(2) Mechanicalgauge

## (1) MANOMETER

Manometers are defined as the devices used for measuring the pressure in a fluid by balancing the column of fluid by the same or another column of the fluid. They are classified as:-
(a) Simplemanometer
(b) Differentialmanometer

## (2) Mechanicalgauge

Mechanical gauge are defined as the devices as the devices used for measuring the pressure by balancing the fluid column by the spring weight or dead weight. The most commonly used mechanical gauges are-
(1) Diaphragmpressuregauge
(2) Bourdontubepressuregauge
(3) Deadweightpressuregauge
(4) Bellowspressuregauge

## SIMPLE MANOMETER

Asimplemanometerconsistsofaglasstubehavingoneend is connected to the pointwhere pressure is to be measured and other end is opened to the atmosphere.
> Commontypeofsimplemanometersare
(1) Piezometer
(2) U-tubemanometer
(3)Singlecolumnmanometer

## PIEZOMETER

Itisthesimplestformofmanometerusedformeasuringgauge pressure. one end of this manometer is connected where pressure is tobemeasuredandotherendisopenedtotheatmosphere.

## U-TUBEMANOMETER

> It consists of a glass tube bent in U-shape, one end of which is connected to a point at where pressure is to be measured and other end remains opens to the atmosphere.
The tube generally contains mercury or any other liquid whose specific gravity is greater than the specific gravity of the liquid whose pressure is to be measured.

## Forgaugepressure

Let $B$ is the point at which pressure is to be measured, whosevalue is $P$. the datum line is $A-A$
Leth $_{1}=$ heightoftheliquid abovedatumline
$h_{2}=$ heightoftheheavyliquidabovedatumline $S_{1}=$
sp. gr. Of light liquid
$\mathrm{S}_{2}=$ sp.gr.Ofheavyliquid
$\varrho_{1}=$ density of light liquid $=S_{1} \times 1000$
$\varrho_{1}=$ densityofheavyliquid $=\mathrm{S}_{2} \times 1000$

Pressure above datum in left limb

$$
=\mathrm{P}+\rho_{1} \mathrm{gh}_{1} \underline{\mathrm{Pr}}
$$

essure above datum in right limb $\quad=_{2} g h_{2}$
Equatingthetwopressures, $\mathrm{P}+\varrho_{1} \mathrm{gh}_{1}=\varrho_{2} \mathrm{gh}_{2}$

$$
P=\rho_{2} g h_{2}-\rho_{1} g h_{1}
$$

Pressure above datum in left limb $=P+\rho_{1} g h_{1}+\rho_{2} g h_{2}$
Pressure above datum in right limb $=0$
Equatingthetwopressures, $\mathrm{P}+\rho_{1} \mathrm{gh}_{1}+\rho_{2} \mathrm{gh}_{2}=0$

$$
P=-\left(\rho_{1} g h_{1}+\rho_{2} g h_{2}\right)
$$

## DIFFERENTIALMANOMETER

$>$ Differential manometers are defined as the devices used for measuringthedifferenceofpressurebetweentwopointsina pipe or in two different pipes.
$>$ A differential manometer consists of a u-tube, containing a heavy liquid, whose two ends are connected to the points, whose pressure is to be measured.
> Mostcommonlytypesofdifferentialmanometersare-
(1) U-tubeDifferentialmanometer
(2) InvertedDifferentialmanometer

## U-TUBEDIFFERENTIALMANOMETER

(a) Let the two points A and B are at different level and also contains liquids of different sp.gr.these two points are connectedtothedifferentialmanometer.Letthepressureat A and $B$ are $P_{A}$ and $P_{B}$.
$P_{A}-P_{B}=h \times g\left(\rho_{g}-\rho_{1}\right)+\rho_{2} g y-\rho_{1} g x$
(b) LetthetwopointsAandBareatsamelevelandalsocontains differentialmanometer.LetthepressureatAandBare $P_{A}$ and $P_{B}$. $P_{A}-P_{B}=h \times g\left(\rho_{\mathrm{g}}-\rho_{1}\right)$

## PROBLEM

The right limb of a simple u-tube manometer containing mercury is open to the atmosphere while the left limb is connected to a pipe in which a fluid of sp. gr. 0.9 is flowing. The centre of the pipe is 12 cm below the mercury in the right limb. Find the pressure of fluid in the pipe if the difference of mercury level in the two limbs is 20 cm .

Solution
Sp.gr.offluid, $\mathrm{S}_{1}=0.9$
Densityoffluid $\left(\rho_{1}\right)=900 \mathrm{~kg} / \mathrm{m}^{3}$ Sp.gr.
of mercury, $\mathrm{S}_{2}=13.6$
Density of mercury $\left(\rho_{2}\right)=13600 \mathrm{~kg} / \mathrm{m}^{3}$
Differenceofmercurylevelh ${ }_{2}=20 \mathrm{~cm}=0.2 \mathrm{~m}$
Heightoffluid fromA-A, $\mathrm{h}_{1}=20-12=8 \mathrm{~cm}=0.08 \mathrm{~m}$
Weknowthatpressure offluidinpipe $P=\rho_{2} g h_{2}-\varrho_{1} g h_{1} P=$

$$
\begin{aligned}
& 13600 \times 9.81 \times 0.2-1000 \times 9.81 \times 0.08 \\
& =26683-706=25977 \mathrm{~N} / \mathrm{m}^{2}=2.5977 \mathrm{~N} / \mathrm{cm}^{2}(\mathrm{ans})
\end{aligned}
$$

### 2.4.1BOURDONTUBEPRESSUREGAUGE

Themostcommontypeofpressuregaugeisabourdon'stube pressure gauge. It is the simple in construction and is generally used for measuring high pressure. A bourdon gauge uses a coiled tube, which as it expands due topressureincreasecausesarotationofanarmconnectedto the tube.

It consists of a hollow coiled metallic tube usually made of bronzeornickelasshowninfig.one endofthetubeissealed and other end is connected to the pipe whose pressure is to be measured. When the pressure in the hollow tube increases,thetubewilltend touncoil andwhenthepressure decreases it will tend to coil more tightly. This movement is transferred through a rack and pinion arrangement connected to a pointer over a calibrated dial, directly giving thepressureoffluid.Thisgaugeiscapableofmeasuringboth positive and negative gauge pressure.

## SHORTQUESTIONS

## 1. Definemanometer?

Manometers are defined as the devices used for measuring the pressure in a fluid by balancing the column of fluid by the same or another column of the fluid. They are classified as:-
(c) Simplemanometer
(d) Differentialmanometer

## 2. Definepiezometer?

Ans-Itisthesimplestformofmanometerusedformeasuringgauge pressure.oneendofthismanometer isconnected wherepressure is to be measured and other end is opened to the atmosphere.

## 3. Whatistheuseofdifferentialmanometer?

Ans-differentialmonometerareusedwheredifferenceofpressure is to be measured.

## LONGQUESTIONS

Explaintheworkingofbourdontubepressuregauge.(2018-S)
Explain absolute pressure, gauge pressure, vacuum pressure and their relationship through a plot. (2019-S) calculatethepressureduetoacolumnof0.5mof
(i) water

(iii) mercury.

Assumethedensityofwater $=1000 \mathrm{~kg} / \mathrm{m}^{3}(2019-\mathrm{S})$
a simple U-tube manometer containing mercury, the left limb is connected to a pipe in which a fluid of sp. gravity 0.8 is flowing.Thecentreofthepipeis6cmbelowthelevelofmercury in right limb. Find the pressure of fluid in pipe of difference of mercury level in two limbs is 18 cm . (2019-S)

## CHAPTER-

## 03HYDROSTATICS

## HYDROSTATIC PRESSURE

$>$ Hydrostatics isthebranchoffluidmechanicswhichdealswiththe study of fluid at rest.
> Thismeansthattherewillbenorelativemotionbetween the adjacent or neighbouring fluid layers.
> Thereisnoshearstressactingonthe fluid.
> Thentheforcesactingonthefluidparticlewillbe-

1. Duetopressureoffluidnormaltothesurface
2. Duetogravity.

## TOTALPRESSUREANDCENTREOFPRESURE

Total pressure is defined as the force exerted by a static fluid on a surface either plane or curved when the fluid comes in contact with the surfaces. This force always acts normal to the surface.

Centre of pressure is defined as the point of application of total pressure on the surface.
> There are four cases of submerged surface on which the total pressure force and centre of pressure is to be determined. The submerged surfaces may be:
(1)Vertical plane surface
(2)Horizontalplanesurface
(3)Inclined plane surface
(4)Curvedplanesurface

## VERTICALPLANESURFACESUBMERGEDINLIQUID

Consideraplaneverticalsurfaceofarbitraryshapeimmersed in a liquid as shown in fig.

LetA=total areaofthe surface
$\mathrm{h}^{-=}=$distanceofC.Goftheareafromthefreesurfaceofliquid $\mathrm{G}=$ centre of gravity of plane surface

P =centreofpressure
$h^{\mathrm{x}}=$ distanceofcentreofthepressurefromthefreesurface of liquid.
totalpressure $(\mathrm{F})=\mathrm{ggAh}^{-}$
centreofpressure, $h^{x}=\left(I_{G} / A h^{-}\right)+h^{-}$

## PROBLEM

A rectangular plane surface is 2 m wide and 3 m deep. It lies in verticalplanein water.Determinethetotalpressureandpositionof centre of pressure on the plane surface when its upper edge is horizonal and (a) coincides with water surface (b) 2.5 m below the free surface.

Solution
Widthofplanesurface, $b=2 m$ Depth
of plane surface, $d=3 m$
(a) Upperedgecoincideswithwatersurface

Total pressure force $(F)=\rho g A h^{-}$

$$
\begin{aligned}
& =1000 \times 9.81 \times(3 \times 2) \times(3 / 2) \\
& =88290 \mathrm{~N}(\mathrm{ans})
\end{aligned}
$$

Centreofpressure

$$
\begin{aligned}
\mathrm{I}_{\mathrm{G}} & =\mathrm{bd}^{3} / 12=2 \times 3^{3} / 12=4.5 \mathrm{~m}^{4} \\
\mathrm{~h}^{\times} & =\left(\mathrm{I}_{\mathrm{G}} / \mathrm{Ah}^{-}\right)+\mathrm{h}^{-} \\
& =4.5 /(6 \times 1.5)+1.5=2.0 \mathrm{~m}(\mathrm{ans})
\end{aligned}
$$

(b) Upperedgeis2.5mbelowwatersurface Total pressure force ( $F$ ) $=\rho g A h^{-}$

$$
\begin{aligned}
& =1000 \times 9.81 \times(3 \times 2) \times(4.0) \\
& =235440 \mathrm{~N}(\text { ans })
\end{aligned}
$$

Centreofpressure

$$
\begin{aligned}
\mathrm{I}_{\mathrm{G}} & =4.5, \mathrm{~A}=6, \mathrm{~h}^{-}=4.0 \\
\mathrm{~h}^{\mathrm{x}} & =\left(\mathrm{I}_{\mathrm{G}} / A h^{-}\right)+\mathrm{h}^{-} \\
& =4.5 /(4.5 \times 6.0)+4.0=4.1875 \mathrm{~m}(\mathrm{ans})
\end{aligned}
$$

### 3.4 BUOYANCY:

Whenabodyisimmersedinaliquid, anupwardforceisexerted bythefluidonthebody. Thisupward force isequaltotheweightof the fluid displaced by the body and is called force of buoyancy or simply buoyancy.

## CENTREOFBUOYANCY

Itisdefinedasthepointthroughwhichforceofbuoyancyis supposed to act.
$>$ As the force of buoyancy is a vertical force and equal to the weightofthefluiddisplacedbythebody,thecentreofbuoyancy will be the centre of gravity of displaced liquid.

### 3.4ARCHIMEDESPRINCIPLE

It states that "The upward buoyant force that is exerted on a body immersed in a fluid, whether partially or fully submerged, is equal to theweightofthefluidthatthebody displacesandactsintheupward direction at the centre of mass of the displaced fluid".

## METACENTRE

> Itlsdefinedasthepointaboutwhicha body startsoscillatingwhen a body is tilted by a small angle.
> Themeta-centremayalsobedefinedasthepointatwhichtheline of action of the force of buoyancy will meet the normal axis of the body when the body is given a small angular displacement.

### 3.4METACENTRICHEIGHT

Thedistancebetween thecentreofgravityandthemetacentreofa floatingbody,asofavessel.Thusmetacentricheightis equalto the distance between G and M .

## PROBLEM

A rectangular pontoon is $5 \mathrm{mlong}, 3 \mathrm{~m}$ wide and 1.20 mhigh . The depthofimmersionofthepontoonis0.80minseawater.Ifthecentre of gravityis0.6mabovethe bottomofthepontoon, determine the meta centricheight. The density forsea water $=1025 \mathrm{~kg} / \mathrm{m}^{3}$.

Solution
Dimensionofpontoon $=5 \mathrm{~m} \times 3 \mathrm{~m} \times 1.20 \mathrm{~m}$

Depthofimmersion $=0.8 \mathrm{~m}$

Distance $\quad A G=0.6 \mathrm{~m}$
Distance $A B=1 / 2 \times$ depthofimmersion

$$
=1 / 2 \times 0.8=0.4 \mathrm{~m}
$$

Densityofseawater $=1025 \mathrm{~kg} / \mathrm{m}_{3}$

$$

### 3.5CONCEPTOFFLOATION

> Asubmergedbody Issaidtobestableifitcomesback toits original position after a slight disturbance.
$>$ The relative position of the centre of gravity and centre of buoyancyofthebody determinesthestabilityofasubmerged body.

## STABILITYOFAFLOATINGBODY

Thepositionofcentreofgravityandcentreofbuoyancy incaseofa completely submerged body are fixed. Consider a balloon, which is completely submerged in air. Let the lower portion of the balloon contains heavier material, so that itscentre of the gravity is lower than its centre of buoyancy as shown in fig.

Let the weight of the balloon is $W$. the weight $W$ is acting through $G$, vertically in the downward direction, while the buoyancy force $F_{b}$ is actingverticallyup, through $B$. forequilibrium of theballoon $W=F_{b}$, if theballoon isgivenanangulardisplacementinclock wisedirectionas shown in fig.(A), then Wand $F_{b}$ constitute acoupleactingin theanticlock wise direction and brings the balloon in original position. Thus the balloon in the position as shown in fig (a) is in stable equilibrium.

STABLE EQUILIBRIUM

(b)

UNSTABLE EQUILIBRIUM

(c)

NEUTRAL EQUILIBRIUM
(a) Stableequilibrium:whenW=FBandpointBisaboveG, the body is said to be in stable equilibrium.
(b) Unstableequilibrium:ifW $=\mathrm{F}_{\mathrm{B}}$, butthecentreofbuoyancy $(\mathrm{B})$ is below the centre of gravity(G) the body is in unstable equilibrium:
(c) Neutral equilibrium: ifW $=\mathrm{F}_{\mathrm{B}}$, and Band Gareatthesame point, as shown in fig. $C$ the body is said to be neutral equilibrium.

## SHORTQUESTIONS

## Q-1)StateArchimedesprinciple.(2018-S,2019-S)

It states that "The upward buoyant force that is exerted on a body immersed in a fluid, whether partially or fully submerged, is equal to theweightofthefluidthatthebody displacesandactsintheupward direction at the centre of mass of the displaced fluid".

## Q-2)Definebuoyancyandmetacentricheight.(2019-S)

buoyancy-Whenabodyisimmersedinaliquid, anupwardforce is exerted by the fluid on the body. This upward force is equal to the weight of the fluid displaced by the body and is called force of buoyancy or simply buoyancy.
metacentricheight-Thedistancebetweenthecentreofgravityand the metacentre of a floating body, as of a vessel. Thus metacentric height is equal to the distance between G and M .

## LONGQUESTIONS

Q-1)Arectangularplanesurfaceis $4 m$ wideand 6 mdeep.Itliesin vertical plane in water. Determine the total pressure and position of centre of pressure on the plane surface when its upper edge is horizontal and-
(i) Coincideswithwatersurface
(ii) 2.5mbelowthewatersurface.(2018-S)

Q-2)explainbrieflyaboutstable, unstableandneutralequilibrium of floating. (2019-S)

Q-3) A Rectangular plate 3 m long and 1 m wide is immersed verticallyinwaterinsuchawaythatits3msideisparalleltothe water surface and is 1 m below it. Calculate (i) total pressure on plate (ii) position of centre of pressure. (2019-S)

Q-4)Ablockofwoodofspecificgravityo.8floatsinwater. Determine the metacentric height of block if its size is $4 \mathrm{~m} \times 2 \mathrm{~m} \times 1.6 \mathrm{~m}$. (2019-S)

## CHAPTER-04

## KINEMATICOFFLOW

## Introduction

Kinematics of flow is the branch of fluid mechanics which deals with the study of fluid motion without consideration of any forces causing motion is called fluid kinematics.

## TYPESOFFLOW

Fluidflowsareclassifiedas:
(1) Steadyandunsteadyflow
(2) Uniformandnon-uniformflow
(3) Laminarandturbulentflow
(4) Compressibleandincompressibleflow
(5) Rotationalandirrotationalflow
(6) Idealandrealflow
(7) One,twoandthreedimensionalflow

## STEADYANDUNSTEADYFLOW

$>$ Steady flow is that type of flow in which fluid parameters (velocity, pressure, density, etc.) at any point in fluid flow field do not change with respect to time.
> Mathematically,

$$
(\Delta V / \Delta t)_{x, y, 2}=(\Delta P / \Delta t)_{x, y, 2}=(\Delta \rho / \Delta t)_{x, y, z}=0
$$

$>$ Unsteady flow is that type of flow in which fluid parameters (velocity, pressure, density, etc.) at any point in fluid flow field changes with respect to time.
> Mathematically,

$$
(\Delta \mathrm{V} / \Delta \mathrm{t})_{\mathrm{x}, \mathrm{y}, \mathrm{zz}} \neq 0(\Delta \mathrm{P} / \Delta \mathrm{t})_{\mathrm{x}, \mathrm{y}, \mathrm{zz}} \neq 0 \quad(\Delta \rho / \Delta \mathrm{t})_{\mathrm{x}, \mathrm{y}, \mathrm{z}} \neq 0
$$

## UNIFORMANDNON-UNIFORMFLOW

Uniformflowisthattypeofflowinwhichthevelocityatany given time does not change with respect to space.
$>$ mathematically

$$
(\Delta \mathrm{V} / \Delta \mathrm{S})_{\mathrm{t}=\text { constant }}=0
$$

> Non-Uniformflowisthattypeofflowinwhichthevelocityatany given time does not change with respect to space.
$>$ mathematically
$(\Delta \mathrm{V} / \Delta \mathrm{S})_{\mathrm{t}=\text { constant }} \neq 0$

## LAMINARANDTURBULENTFLOW

$>$ laminar flow is defined as that type of flow in which the fluid particles move along well-defined paths or stream line and all the stream lines are straight and parallel.
$>$ Turbulent flow is defined as that type of flow in which the fluid particles moves in a zigzag way
> If the Reynolds number is less than 2000, the flow is called laminarandifthe Reynolds numberismore than 4000 thenthe flowisturbulent, andiftheReynoldsnumberisinbetween2000 to 4000 the flow is either laminar or turbulent.

## COMPRESSIBLEANDINCOMPRESSIBLEFLOW

> Compressible flow is that type of flow in which the density of fluidchangesfrompointtopointorinotherwordsdensityisnot constant for the fluid.
$>$ Compressible flow is that type of flow in which the density of fluiddonotchangefrompointtopointorinotherwordsdensity is constant for the fluid.

## ROTATIONALANDIRROTATIONALFLOW

$>$ Rotational flow is that types of flow in which the fluid particle while in moving along stream line also rotate about their own axis.
$>$ Irrotational flow is that types of flow in which the fluid particle whileinmovingalongstreamlinedonotrotateabouttheirown axis.

## RATEOFFLOWORDISCHARGE(Q)

$>$ It is defined as thequantity of fluid flowing per second through asectionofapipeorachanneliscalledrateofflowordischarge.
$>$ For an incompressible fluid (liquid) the rate of discharge is expressed as the volume of fluid flowing across the section per second.
$>$ Forcompressiblefluid(gas)therateofdischargeisexpressedas the weight of fluid flowing across the section per second. Consider a liquid flowing through a pipe in which

A=cross-sectionalareaofpipe
$\mathrm{V}=$ averagevelocityoffluidacrossthesectional
Then discharge $Q=A \times V$

## CONTINUITYEQUATION

It states that "the mass of a fluid passing through different cross-section of a pipe, and its flow is same if no fluid is added or removed from the pipe".
Considertwocrosssectionofapipeasshowninfig.

Let, $\mathrm{V}_{1}=$ averagevelocityatcross-section1-1 $\mathrm{A}_{1}=$ area at section 1-1
$\varrho_{1}=$ densityoffluidatsection1-1
$\mathrm{V}_{2}=$ averagevelocityatcross-section2-2 $\mathrm{A}_{2}=$ area at section 2-2
$\varrho_{2}=$ density of fluid at section 2-2
thentherateofflowinsection1-1 $=\varrho_{1} \mathrm{~A}_{1} \mathrm{~V}_{1}$ rate
of flow in section 2-2 $=\varrho_{2} \mathrm{~A}_{2} \mathrm{~V}_{2}$
accordingtoconservationofmass
Rateofflowatsection1-1=rateofflowatsection2-2

$$
\rho_{1} \mathrm{~A}_{1} \mathrm{~V}_{1}=\rho_{2} \mathrm{~A}_{2} \mathrm{~V}_{2}
$$

ifthefluidisincompressiblethan $\varrho_{1}=\varrho_{1}$ andcontinuityequation reduces to $A_{1} \mathrm{~V}_{1}=\mathrm{A}_{2} \mathrm{~V}_{2}$

## BERNOULLI'STHEOREM

Itstates"inanidealincompressiblefluidwhentheflowissteadyand continuous then the sum of potential energy, kinetic energy and pressure energy is constant along a stream line".

Mathematically

$$
(\mathrm{P} / \mathrm{\rho g})+\left(\mathrm{V}^{2} / 2 \mathrm{~g}\right)+\mathrm{Z}=\text { constant }
$$

## Proof

Consider an incompressible liquid is flowing through a non-uniform pipeasshowninfig.considertwosectionsAAandBBofthepipe.Let the pipe is running full and there is a continuity of flow between the two sections.

Let $Z_{1}, P_{1}, V_{1}$ and $A_{1}$ be the height above datum, pressure intensity, velocity and area of pipe respectively at section A.A.

LetZ,P,VandAbethecorrespondingquantitiesatsectionBB.letthe liquidbetweenthesectionAAand $B B$ movestoposition $A_{1} A_{1}$ and $B_{1} B_{1}$ in an infinitely small interval of time.

LetWbetheweightofliquidbetweenAAand $\mathrm{A}_{1} \mathrm{~A}_{1}$ orBBand $\mathrm{B}_{1} \mathrm{~B}_{1}$.
As the flow is continuous
$\mathrm{W}=\left(\mathrm{A}_{1} \mathrm{dl}_{1}\right) \mathrm{w}=\left(\mathrm{A}_{2} \mathrm{dl}_{2}\right) \mathrm{w}$
Wherew=sp.weightoffluid.
$\left(\mathrm{A}_{1} \mathrm{dl}_{1}\right) \mathrm{w}=\mathrm{W} \quad \therefore\left(\mathrm{A}_{1} \mathrm{dl}_{1}\right)=\mathrm{W} / \mathrm{w}$
$\left(\mathrm{A}_{2} \mathrm{dl}_{2}\right) \mathrm{w}=\mathrm{W} \quad \therefore\left(\mathrm{A}_{2} \mathrm{dl}_{2}\right)=\mathrm{W} / \mathrm{w}$.
Fromequation(1) and(2)
Weget $\left(\mathrm{A}_{1} \mathrm{dl}_{1}\right)=\left(\mathrm{A}_{2} \mathrm{dl}_{2}\right)=\mathrm{W} / \mathrm{w}$
Work-donebythepressureatAAismovingtheliquidto $\mathrm{A}_{1} \mathrm{~A}_{1}$

$$
=\text { force } \times \text { distance }=\left(\mathrm{P}_{1} \mathrm{~A}_{1}\right) \times \mathrm{dl}_{1}=\mathrm{P}_{1} \mathrm{~A}_{1} \mathrm{dl}_{1}
$$

Similarly,workdonebythepressureat $B$ Binmovingtheliquidto $B_{1} B_{1}=$

- $\mathrm{P}_{2} \mathrm{~A}_{2} \mathrm{dl}_{2}$
(MinussignshowsthatthedirectionofP ${ }_{2}$ isoppositeto $_{1}$ ) Total work done by pressure

$$
\begin{aligned}
& =\mathrm{P}_{1} \mathrm{~A}_{1} \mathrm{dl}_{1}-\mathrm{P}_{2} \mathrm{~A}_{2} \mathrm{dl}_{2} \\
& =\mathrm{P}_{1} \times(\mathrm{W} / \mathrm{W})-\quad \mathrm{P}_{2} \times(\mathrm{W} / \mathrm{W}) \\
& =(\mathrm{W} / \mathrm{W}) \times\left(\mathrm{P}_{1}-\mathrm{P}_{2}\right)
\end{aligned}
$$

Lossofpotentialenergy $=\mathrm{WZ}_{1}-\mathrm{WZ}_{2}=\mathrm{W}\left(\mathrm{Z}_{1}-\mathrm{Z}_{2}\right)$ Gain in kinetic energy $=\mathrm{W} / 2 \mathrm{~g}\left(\mathrm{~V}_{2}{ }^{2}-\mathrm{V}_{1}{ }^{2}\right)$

Weknowthat,

Lossofpotentialenergy+workdonebypressure=gaininkinetic energy
$W\left(Z_{1}-Z_{2}\right)+(W / w) \times\left(P_{1}-P_{2}\right)=W / 2 g\left(V_{2}{ }^{2}-V_{1}{ }^{2}\right)$

$$
\left(Z_{1}-Z_{2}\right)+1 / w\left(P_{1}-P_{2}\right)=1 / 2 g\left(V_{2}^{2}-V_{1}^{2}\right)
$$

$\mathrm{Z}_{1}-\mathrm{Z}_{2}+\mathrm{P}_{1} / \mathrm{w}-\mathrm{P}_{2} / \mathrm{w}=\mathrm{V}_{2}{ }^{2} / 2 \mathrm{~g}-\mathrm{V}_{1}{ }^{2} / 2 \mathrm{~g}$
$\mathrm{Z}_{1}+\mathrm{V}_{1}{ }^{2} / 2 \mathrm{~g}+\mathrm{P}_{1} / \mathrm{w}=\mathrm{Z}_{2}+\mathrm{V}_{2}{ }^{2} / 2 \mathrm{~g}+\mathrm{P}_{2} / \mathrm{w}$
i.e.thesumofpotentialhead,kineticheadandpressureheadisconstant.

### 4.3VENTURIMETER

Aventurimeterisadeviceusedformeasuringtherateofaflowafluid flowing through a pipe. It consists of three parts:
(1) Ashortconvergingpart(2)Throat
(3)Divergingpart

## VENTURIMETER

A venturimeter is a device used for measuring the rate of flow of a fluid flowing through a pipe

## Dischargethroughventuri-meter

$$
Q_{a c t}=C_{d} \frac{a_{1} a_{2}}{\sqrt{a_{1}^{2}-a_{2}^{2}}} \sqrt{2 g h}
$$

$$
\text { Where, } \begin{aligned}
\mathrm{C}_{\mathrm{d}} & =\text { coefficientofdischarge } \mathrm{A}_{1} \\
& =\text { area at inlet } \\

```

$$
\mathrm{C}_{\mathrm{d}}=0.98
$$

Reading of differential manometer $=x=20 \mathrm{~cm}$ of mercury
Differenceofpressurehead, $\mathrm{h}=\mathrm{x}\left(\mathrm{S}_{\mathrm{h}} / \mathrm{S}_{\mathrm{o}}-1\right)=252 \mathrm{cmofwater}$

$$
=125.756 \mathrm{lit} / \mathrm{s}
$$

## SHORTQUESTIONS

Defineuniformandlaminarflow.2018-S
Ans-Uniformflowisthattypeofflowinwhichthevelocityatany given time does not change with respect to space.
mathematically

$$
(\Delta \mathrm{V} / \Delta \mathrm{S})_{\mathrm{t}=\text { constant }}=0
$$

laminarflowisdefinedasthattypeofflowinwhichthefluidparticles move along well-definedpaths or streamlineand all thestreamlines are straight and parallel.

## Defineaboutnonuniformflowandturbulentflow.2019-S

Non-Uniform flow isthattype of flowinwhich the velocityat any given time does not change with respect to space.
mathematically
$(\Delta \mathrm{V} / \Delta \mathrm{S})_{\mathrm{t}=\text { constant }} \neq 0$
Turbulent flow is defined as that type of flow in which the fluid particles moves in a zigzag way
whatisthedifferencebetweenlaminarflowandturbulentflow. 2019-S
laminarflowisdefinedasthattypeofflowinwhichthefluidparticles move alongwell-definedpathsor streamlineand allthestreamlines are straight and parallel.

Turbulent flow is defined as that type of flow in which the fluid particles moves in a zigzag way

IftheReynoldsnumberislessthan2000,theflowiscalledlaminarand if the Reynolds number is more than 4000 then the flow is turbulent, and if the Reynolds number is in between 2000 to 4000 the flow is either laminar or turbulent.

## whatisthefunctionofventurimeter.2019-S

Venturi meter Is a device used to measure the rate of flow or discharge in a pipe.

## LONGQUESTION

Statecontinuityequationandproveitforonedimensionalflow. (2018-S)
water is flowing through a pipe having diameter 300 mm and 200 mm at bottom and upper end respectively. The intensity of pressure at bottom end is $24.525 \mathrm{~N} / \mathrm{cm}^{2}$ and the pressure at the upper end is $9.81 \mathrm{~N} / \mathrm{cm}^{2}$, determine the difference in datum head if the rate of flow through the pipe is 40lit/sec. (2018-S)

Water flows through a $300 \mathrm{~mm} \times 150 \mathrm{~mm}$ horizontal venturi meter at the rate of $0.04 \mathrm{~m}^{3} / \mathrm{sec}$. A differential manometer with gauge liquid of specific gravity of 1.25 indicates a deflection of 1.05 m . calculate the coefficient of discharge for the venturi meter. (2019-S)

What Is pitot tube. Why it is used. Derive an expression for velocity of liquid flow at any point in a pipe by using pitot tube. (2019-S)

## CHAPTER-05

## ORIFICES,NOTCHES\&WEIRS

## 5.1-ORIFICE

$>$ Orificeisasmallopeningofanycross-section(suchascircular, triangular, rectangular etc.) on the side or at the bottom of a tank, through which a fluid is flowing.
$>$ Itisusedformeasuringtherateofflowordischarge.

## Classificationoforifices

Theorificesareclassifiedonthebasispf theirsize,shape,nature of discharge and shape of the upstream edge. The following are the important classifications-
(1) The orifices are classified as small orifice or large orifice depending upon the size of the orifice and head of liquid from the centre of the orifice. If the head of liquid from the centre oforificeis morethan fivetimesthedepth oforifice, the orifice is called small orifice. And if the head of the liquidsislessthanfivetimesthedepthoforifice,itisknown as large orifice
(2) Theorificesareclassifiedas(i)circularorifices,(ii)triangular orifices, (iii) rectangular orifices (iv) square orifices depending upon their cross-sectional areas.
(3) Theorificesareclassifiedas(i)sharp edgedorifice,(ii)bellmouthedorificedependingupontheupstreamedgeofthe orifices.
(4) Theorificesareclassifiedas(i)freedischargingorificesand (ii)drownedorsubmergedorificesdependinguponthe nature of discharge.
Thesub-mergedorificesarefurtherclassifiedas(a)fullysubmerged orifices and (b) partially sub- merged orifices.

## FLOWTHROUGHAN ORIFICE

Consider a tank fitted with a circular orifice in one of its sides as shown in fig. let H be the head of liquid above the centre of the orifice. The liquid flowing through the orifice forms a jet of liquid whose area of cross-section is less than thatoforifice.Theareaofjetoffluidgoesondecreasingand at a section CC, the area is minimum. This section is called venacontracta. Beyond this section the jet diverges and is attracted to the downward direction by the gravity.

Considertwopoints1and2asshownin_figure.Point1is inside the tank and point 2 is vena-contracta.

LettheflowissteadyandataconstantheadH.by applying Bernoulli's equation at point 1_and 2.

$$
\mathrm{Z}_{1}+\mathrm{V}_{1}^{2} / 2 \mathrm{~g}+\mathrm{P}_{1} / \mathrm{w}=\mathrm{Z}_{2}+\mathrm{V}_{2}^{2} / 2 \mathrm{~g}+\mathrm{P}_{2} / \mathrm{w}
$$

But,

$$
\mathrm{Z}_{1}=\mathrm{Z}_{2}
$$

$$
\mathrm{V}_{1}^{2} / 2 \mathrm{~g}+\mathrm{P}_{1} / \mathrm{w}=\mathrm{V}_{2}^{2} / 2 \mathrm{~g}+\mathrm{P}_{2} / \mathrm{w} \text { Now, }
$$

$P_{1} / w=H$

$$
\mathrm{P}_{2} / \mathrm{w}=0 \text { (atmospheric) }
$$

$\mathrm{V}_{1}$ isverysmallincomparisonto $\mathrm{V}_{2}$ astheareaofthetankis very large as compared to the area of the jet of the liquid.

$$
\begin{aligned}
& \mathrm{H}+0=0+\mathrm{V}_{2}^{2} / 2 \mathrm{~g} \mathrm{~V}_{2}= \\
& \mathrm{V}(2 \mathrm{gH})
\end{aligned}
$$

Thisisthetheoreticalvelocity.Actualvelocitywillbelessthanthis value.

## ORIFICECO-EFFICIENTS

Thehydrauliccoefficient'sare-
(1) co-efficientofvelocity, $\mathrm{C}_{v}$
(2) co-efficientofcontraction, $\mathrm{C}_{\mathrm{c}}$
(3) $\mathrm{co}-$

dh=Thicknessofelementaryhorizontalstripofwaterflowingover the triangular notch or weir
$\mathrm{h}=$ Depthofelementaryhorizontalstripofwaterfromfreesurfaceof water $\mathrm{C}_{\mathrm{d}}=$ Co-efficientofdischarge

WewilldeterminethevalueofdischargedQthroughtheelementary horizontalstripof water. Aftersecuringtheexpressionfordischarge through the elementary horizontal strip, we will integrate the expression between the limit 0 to H and we will have the expression for the discharge over entire triangular notch or weir.

## $\mathrm{dQ}=\mathrm{C}_{\mathrm{d}} \mathrm{XAreaofstripxTheoreticalvelocity}$

## Areaofstrip

Firstwewillsecurethevalueofareaofhorizontalelementarystrip

$$
\begin{aligned}
\tan \frac{\theta}{2} & =\frac{A C}{O C}=\frac{A C}{(H-h)} \\
A C & =(H-h) \tan \frac{\theta}{2} \\
\text { Width of strip } & =A B=2 A C=2(\mathrm{H}-h) \tan \frac{\theta}{2} \\
\text { Area of strip } & =2(\mathrm{H}-h) \tan \frac{\theta}{2} \times d h
\end{aligned}
$$

Nowwewillsecureheretheexpressionfor

$$
\begin{aligned}
& =2 \times C_{d} \times \tan \frac{\theta}{2} \times \sqrt{2 g}\left[\frac{2}{3} H . H^{3 / 2}-\frac{2}{5} H^{5 / 2}\right] \\
& =2 \times C_{d} \times \tan \frac{\theta}{2} \times \sqrt{2 g}\left[\frac{2}{3} H^{5 / 2}-\frac{2}{5} H^{5 / 2}\right] \\
& =2 \times C_{d} \times \tan \frac{\theta}{2} \times \sqrt{2 g}\left[\frac{4}{15} H^{5 / 2}\right] \\
& =\frac{8}{15} C_{d} \times \tan \frac{\theta}{2} \times \sqrt{2 g} \times H^{5 / 2}
\end{aligned}
$$

For a right-angled $V$-notch, if $C_{d}=0.6$

$$
\begin{aligned}
\theta & =90^{\circ}, \quad \therefore \quad \tan \frac{\theta}{2}=1 \\
Q & =\frac{8}{15} \times 0.6 \times 1 \times \sqrt{2 \times 9.81} \times H^{5 / 2} \\
& =1.417 H^{5 / 2}
\end{aligned}
$$

Discharge

## PROBLEM

The head of water over an orifice of diameter 100 mm is 10 m . the water is coming out from the orifice is collectedinacirculartankofdiameter1.5m.theriseof water level in this tank is 1.0 m in 25 seconds. Also the co-ordinates of a point on the jet, measured from vena-contractaare 4.3 mhorizontaland 0.5 mvertical. Find the coefficients, $C_{d}, C_{v}, C_{c}$.

## SolutionDat

agiven
Head,H=10m
Diaoforifice, $\mathrm{d}=100 \mathrm{~mm}=0.1 \mathrm{~m}$ Area
of orifice, $a=0.007853 \mathrm{~m}^{2}$

Diaofmeasuring tank, $\mathrm{D}=1.5 \mathrm{~m}$
Area of the tank, $A=1.767 \mathrm{~m}^{2}$
Rise of water level, $h=1 \mathrm{~m}$
Intime= 25sec
Horizontaldistance, $\mathrm{x}=4.3 \mathrm{~m}$ Vertical
distance, $\mathrm{y}=0.5 \mathrm{~m}$
Nowtheoretical velocity, $\mathrm{V}_{\mathrm{th}}=\sqrt{ }(2 \mathrm{gH})=\sqrt{ }(2 \times 9.81 \times 10)=14 \mathrm{~m} / \mathrm{s}$ Theoretical discharge, $Q_{\text {th }}=V_{\text {th }} X$ area of orifice

$$
=14 \times 0.007854=0.1099 \mathrm{~m}^{3} / \mathrm{s}
$$

Actual discharge, Qact $=$ A X h / $\mathrm{t}=1.767 \times 1.0 / 25=0.07068$

$$
\mathrm{C}_{\mathrm{d}}=\mathrm{Q}_{\text {act }} / \mathrm{Q}_{\text {th }}=0.07068 / 0.1099=0.643 \text { (ans) }
$$

Co-efficientofvelocity, $\mathrm{C}_{\mathrm{v}}=\mathrm{x} / \sqrt{ }(4 \mathrm{yH})=4.3 /(4 \times 0.5 \times 10)$

$$
=0.96 \mathrm{ans}
$$

Co-efficientcontractionC $\mathrm{C}_{\mathrm{c}}=\mathrm{C}_{\mathrm{d}} / \mathrm{C}_{\mathrm{v}}=0.643 / 0.96=0.669$ (ans)

## IMPORTANTQUESTIONS

1.Defineorificeandnotch.

Ans-Anotchisadeviceusedformeasuringthegateofflowofálliquid a through asmall chaninehona tanka tank.
Anotchisadeviceusedformeasuringtherateofflowofalliquid a liquid through a small channel or a tank.

## Longquestions

1. Defineorificecoefficientsandestablishtherelationbetween them.
2. Deriveanexpressionfordischargeoverrectangularorifice.
3. Deriveanexpressionfordischargeovertriangularorifice.

## CHAPTER-

## 06FLOWTHROUGHPIP

## E

## DEFINITIONOF PIPE

Pipeisaclosedconduitwhichisusedtoconveyliquidsandgases.

## LOSSOFENERGYINPIPES

Whenafluidis flowingthroughapipe,thefluidexperiencessome resistance due to which some of the energy of fluid is lost. This loss of energy is classified as:

Major energy losses:The viscosity causes loss of energy in the flows, which isknown asfrictionallossormajorenergylossanditis calculated by the following formula;
(a)Darcy-weisbachformula
(b) Chezy'sformula

Minor energylosses:Thelossofenergyduetochangeofvelocityof the flowing fluid in magnitude or direction is called minor loss of energy. The minor loss of energy includes the following cases-
a. Suddenexpansionofpipe
b. Suddencontractionofpipe
c. Bendinginpipe
d. Pipefittings

## HEADLOSS DUETO FRICTION

(a) Darcy-weisbachformula

Thelossofheadcanbemeasuredbythefollowingequations $\mathrm{h}_{\mathrm{f}}=4 \mathrm{f}$
$\mathrm{LV}^{2} /(2 \mathrm{gd})$
Wherehf=Lossofhead duetofriction
f =Co-efficientoffrictionwhichisafunctionofReynolds
number

$$
\begin{aligned}
\mathrm{f}= & 64 / \mathrm{R}_{\mathrm{e}}(\text { forRe<2000 }) \text { (laminarflow) } \\
& =0.079 / \mathrm{R}_{\mathrm{e}}^{1 / 4} \text { forRvaryingfrom4000to } 10^{6}(\text { turbulent }
\end{aligned}
$$

flow)
L=Lengthofpipe
$\mathrm{V}=$ meanvelocityofflow $\mathrm{D}=$
Diameter of pipe
(b) chezy's formula

$$
h_{f}=\frac{f^{\prime}}{\rho g} \times \frac{P}{A} \times L \times V^{2}
$$

Where, hf =loss of headduetofriction P
= perimeter of pipe
A =areaofcrosssectionofpipe $L=$
length of pipe
$\mathrm{V}=$ meanvelocityof flow

NowtheratioofA/p $=($ areaofflow/wetted perimeter $)$ iscalled hydraulic mean depth. It is denoted by m .

Hydraulicmeandepth, $\mathrm{m}=\mathrm{A} / \mathrm{P}=\mathrm{d} / 4$

$$
\mathrm{V}=\mathrm{C} \sqrt{ }(\mathrm{mi})
$$

## problem

Find the headlost dueto friction ina pipeof diameter300mm andlength50mthroughwhichwaterisflowing ata velocityof $3 \mathrm{~m} / \mathrm{s}$ using (i) Darcy weisbach (ii) Chezy's Formula (c=60)
(TakeV=0.01stoke(forwater))

## Solution:

Given:Diameterofthepipe, $\mathrm{d}=300 \mathrm{~mm}$ (divideby' 1000 'toconvert it from 'mm' to 'm')

Diameterd $=0.3 \mathrm{~m}$
Length, L=50m
Velocity, $v=3 \mathrm{~m} / \mathrm{s}$
KinematicViscosity, $\mathrm{V}=0.01$ stoke
$V=0.01 \mathrm{~cm} 2 / \mathrm{s}$
$V=0.01 \times 10^{-4} \mathrm{~m}^{2} / \mathrm{s}$
ByDarcy's Formula,
$h f=4 f \times L \times v^{2} \times d \times 2 g$
weknowco-efficientoffriction
$\mathrm{f}=0.079 \mathrm{Re}$
$\therefore \mathrm{Re}=\mathrm{V} \times \mathrm{dv}=3.0 \times 0.300 .01 \times 10^{-4}$
$\mathrm{Re}=9 \times 10^{5}$
$\therefore \mathrm{f}=0.079(9 \times 105) 14$
$\mathrm{f}=2.56 \times 10-3$
orf $=0.00256$
Therefore, Headlost, $\mathrm{hf}=4 \times 0.00256 \times 50 \times 320.3 \times 2.0 \times 9.81$
$\mathrm{hf}=782.87 \times 10-3$
$\mathrm{hf}=0.7828 \mathrm{~m}$
NowbyusingChezy'sformula:-
$\mathrm{V}=\mathrm{c} \sqrt{\mathrm{mi}}$
where, $\mathrm{c}=60, \mathrm{~m}=\mathrm{d} 4=0.304=0.075 \mathrm{~m}$
$3=60 \sqrt{ } 0.075$
$\mathrm{i}=(360) 2 \times 10.075$
Byequating,weget
$\mathrm{i}=0.333$
But,i=hfL
$\therefore, 0.333=h f 50$
$\therefore \mathrm{hf}=1.665 \mathrm{~m}$

## HYDRAULICGRADIENTLINE

Hydraulic gradientlineisbasicallydefinedasthelinewhich willgive the sum of pressure head and datum head or potential head of a fluid flowing through a pipe with respect to some reference line.

Hydraulicgradientline=Pressure head+Potentialhead ordatum head H.G.L $=\mathrm{P} / \rho \mathrm{g}+\mathrm{Z}$

Where,
H.G.L=Hydraulicgradientline $\mathrm{P} / \mathrm{\rho g}$
= Pressure head
Z=Potentialhead ordatumhead

### 6.5TOTALENERGYLINE

Totalenergylineisbasicallydefinedasthelinewhichwillgivethe sum of pressure head, potential head and kinetic head of a fluid flowing through a pipe with respect to some reference line.

Totalenergyline $=$ Pressurehead + Potentialhead + Kinetichead

$$
\text { H.G.L=P/ } \mathrm{g}+\mathrm{Z}+\mathrm{V}^{2} / 2 \mathrm{~g}
$$

Where,
T.E.L=Totalenergyline
$\mathrm{P} / \rho \mathrm{g}=$ Pressure head
$\mathrm{Z}=$ Potential head or datum head
$\mathrm{V}^{2} / 2 \mathrm{~g}=$ Kineticheadorvelocityhead

## Relationbetweenhydraulicgradientlineandtotalenergyline

H.G.L=E.G.L-V²/2g

## IMPORTANTQUESTIONSSH

## ORT QUESTIONS

## 1. Definehydraulicgradientline.

Ans-Hydraulic gradient line is basically defined as the line which will give the sum of pressure head and datum head or potentialheadofafluidflowingthrough apipewith respectto some reference line.

## 2. Definepipeandhydraulicmeandepth.

## Ans-

Pipe-itisaclosed conduitwhichisusedtocarryfluidunder pressure.
Hydraulicmeandepth-itisdefinedastheareaofflowsection divided by the top water surface width.

## LONGQUESTIONS

1. Writedowntheexpressionoflossofenergyduetofriction accordingtoDarcy'sformulaandChezy'sformulawithproper notation.
2. WriteinbriefaboutFroude'slawoffluidfriction.
3. Find the head lost due to friction in a pipe of diameter 200 mm and 300 mm lengththroughwhichwaterisflowingwithavelocity of $5 \mathrm{~m} / \mathrm{s}$ using-
i. Darcy'sformula
ii. Chezy'sformula,takeC=50andf=0.0079

## CHAPTER -

## 07IMPACTOFJE

## INTRODUCTION <br> I

The liquid comes out in the form of a jet from the outlet of the nozzle fittedinthe outlet ofthepipe through whichthe liquid is flowing under pressure. if some plate, which may be fixed or moving is placed in the path of the jet, a force is exerted by the jet on the plate. This force exerted by the jet on the plate is called impact of jet.

### 7.1IMPACTOFJETONFIXEDPLATEWHENTHEPLATEIS VERTICAL TO THE JET

Considerajet of watercomingoutofthenozzle,strikes aflat vertical plate as shown in the Figure 1.

Figure 1
let,
$\rho=$ densityofwater
$a=$ areaof jet=(п/4)d ${ }^{2}$
$\mathrm{v}=$ absolutevelocityof jet
Thejetafterstrikingtheplatewillmovealongtheplate.
But the plate is right angles to the jet. Hence the jet after strikingwill get deflectedby $90 \hat{A}^{\circ}$. Hencethecomponent ofthe velocity of the jet, inthe direction of thejet, afterstrikingwill be zero.

Theforce exerted by thejeton the platein thedirection of the jet.
$=($ initialmomentum-finalmomentum)/time
$=$ mass $\times($ initialvelocity-finalvelocity)/time
$=$ mass/time(initialvelocity-finalvelocity)
$=\rho a v(\mathrm{v}-0)$
$=\rho a v^{2}$

For deriving the above equation, we have taken initial velocity minus final velocity and not final velocity minus initial velocity. If the force exerted on the jet is to be calculated then final minus the initial velocity is taken. But if the force exertedbythe jet onthe plate istocalculated, theninitial velocityminus the final velocity is taken.

### 7.1IMPACTOFJETONMOVINGPLATEWHENTHEPLATEIS

## VERTICAL TO THE JET

## Consider,ajetofwaterstrikestheflatmovingplate movingwithauniformvelocityawayfrom thejet.

v=Velocityofjet
u=velocityofflatplate
Relativevelocityofjetw.r.tplate=v-u

Mass ofwaterstriking/secontheplate= $\rho a(v-u)$
Forceexertedby jet onthemovingplateinthedirection of jet
$F_{X}=$ Massofwaterstriking/secx[Initialvelocity-Final velocity]
$=\rho a(V-u)[(V-u)-0]$
$=\rho a(V-u)^{2}$
In thiscase, work is donebythejet ontheplateas theplateis moving,
Workdonebythejetontheflatmovingplate

$$
\begin{aligned}
& =\text { ForcexDistanceinthedirectionofforce/Time } \\
& =F_{x} u=\rho a(V-u)^{2} u
\end{aligned}
$$

## Problem

Wateris flowing through a pipe atthe end of which anozzle is fitted. The diameter of nozzle is 100 mm , and the head of water at the centre nozzle is 100 mm . find the force exerted by the jet of water on a fixed vertical plate. The coefficient if velocity is given as 0.95 .
solution

## givendata

diameter of nozzle, $\mathrm{d} \quad=100 \mathrm{~mm}=0.1 \mathrm{~m}$
head of water, $\mathrm{H}=100 \mathrm{~m}$
coefficient of velocity, $\mathrm{C}_{\mathrm{v}}=0.95$ area
of thenozzle , $a=0.007854 \mathrm{~m}^{2}$
theoreticalvelocityofjet,
$V_{\text {th }}=\sqrt{ }(2 \mathrm{gh})=\sqrt{ }(2 \times 9.81 \times 100)=44.294 \mathrm{~m} / \mathrm{s}$
$\mathrm{C}_{\mathrm{v}}=$ actual velocity/ theoretical velocity
Actual velocity $=\mathrm{C}_{\mathrm{v}} \mathrm{x}$ theoretical velocity

$$
=0.95 \times 44.294=42.08 \mathrm{~m} / \mathrm{s}
$$

$F=\rho a v^{2}=1000 \times 0.007854 \times 42.08^{2}=13907.2 \mathrm{~N}=13.9 \mathrm{KN}$

### 7.1FORCEEXERTEDBY AJETON ASTATIONARYINCLINED

 FLAT PLATE:Let a jet of water,comingoutfrom the nozzle;strikean inclined flat plate as shown in the figure.2.

Figure. 2.

Let
$a=$ areaof jet=(n/4)d ${ }^{2}$
$v=$ velocity of thejetinthe direction of $X \theta$
= Angle between the jet and the plate
thenmassofwaterpersecondstrikingtheplate= $\rho$ av
If the plate is assumedsmooth and if it is assumedthat there is no loss of energy due to the impact of the jet, then the jet will move over the plate after striking with a velocity equal to initial velocity i.e., with a velocity V.

Let findtheforce exerted by the jet onthe plateln thedirection normal to the plate. Let this force is represented by $F_{n}$
then, $F_{n}=$ Mass of the jet strikingper secondÃ[initial velocityof the jet before striking in the direction of $n$ - final velocity of the jet after striking in the direction of $n$

$$
F_{n}=\rho a v[v \sin \theta-0]=\rho a v^{2} \sin \theta
$$

If the force can be resolved into two components, one in the directionofthe jet andthe other perpendiculartothe direction of the flow. Then we have,
$F_{x=} \rho a v^{2} \sin \theta$
(alongthedirectionoftheflow) and $\mathrm{F}_{\mathrm{y}=}$
$\rho \mathrm{av}^{2} \sin \theta \cos \theta$
(perpendiculartoflow)

### 7.1FORCEEXERTEDBY AJET ON AMOVING INCLINEDFLAT PLATE:

Consider,ajetofwaterstrikestheflatmovingplate movingwithauniform velocityaway fromthe jet.

$\mathrm{v}=$ Velocityofjet
$u=$ velocityofflatplate
Relativevelocityofjetw.r.tplate=v-u
If the plate is smooth, it is assumed that the loss of energydue to impact of jet is zero, then the jet of water leaves the inclined plate with a velocity $(\mathrm{V}-\mathrm{u})$.

Force exerted by jet onthe inclined plate inthedirection normal to the jet
$F_{n}=$ Mass of water striking/ sec x[Initial velocity - Final velocity]

$$
\begin{aligned}
& =\rho a(V-u)[(V-u) \sin \theta-0] \\
& =\rho a(V-u)^{2} \sin \theta
\end{aligned}
$$

Thisnormalforcecanberesolvedintotwocomponents one in the direction of jet and other perpendicular to the direction of jet

ComponentofFninthedirection ofjet.
$\underline{F}_{x}=\rho a(V-u)^{2} \sin ^{2} \theta$

Component ofFn inthe directionperpendicular to the direction of jet

## $\mathrm{F}_{\mathrm{y}}=\rho \mathrm{a}(\mathrm{V}-\mathrm{u})^{2} \sin \theta \cos \theta$

Workdonebythejet ontheflatmoving plate
$=$ ForcexDistanceinthedirectionofforce/ Time
$=\rho a(V-u)^{2} \sin ^{2} \theta x u$

\end{aligned}
$$

$$
u=\frac{v}{2}
$$

## Putthe valuesofu in 7.3IMPACTOFJET ONMOVINGCURVEDVAZNES

Considerajet of waterenteringandleavingamowingcurved vane as shown in fig. 4

$$
\eta_{\max }=\frac{2 \overline{2}\left(\nabla^{2}-\overline{2}\right)}{v^{2}}
$$

Fig-4 : Jet impinging on a moving curved vane
Let, $\bullet \mathrm{V}=\mathrm{Velocityofthejet(AC)} ,\mathrm{while} \mathrm{entering} \mathrm{the} \mathrm{vane}$,

- $\mathrm{V}_{1}=$ Velocityofthejet(EG), whileleavingthe vane,
- $\mathrm{U}_{1}, \mathrm{U}_{2}=$ Velocityofthevane(AB,FG)
- $\alpha=$ Angle withthe direction of motion of thevane, at which the jet enters the vane,
- $\beta$ =Anglewith thedirection of motion of thevane, at whichthe jet leaves the vane,
- $\mathrm{V}_{\mathrm{r}}=$ Relative velocityof the jet and the vane (BC) at entrance (it is the vertical difference between V and $\mathrm{U}_{1}$ )
- $\mathrm{V}_{\mathrm{r} 1}=$ Relative velocity of thejetand the vane (EF) at exit (it is the vertical difference between $\mathrm{V}_{1}$ and $\mathrm{U}_{1}$ )
- $\Theta=$ Angle, which Vrmakes with the direction ofmotion of the vane at inlet (known as vane angle at inlet),
- $\beta=$ Angle, which $V_{r 1}$ makes with the direction of motionof the vane at outlet (known as vane angle at outlet)
- $\mathrm{V}_{\mathrm{w}}=$ Horizontal component of V ( $A D$, equal to). It is a component paralleltothe directionof motionof the vane (known as velocity of whirl at inlet),
- $\mathrm{V}_{\mathrm{w} 1}=$ Horizontalcomponent ofV1 (HG, equalto).It isa component parallel to the direction of motion of the vane (known as velocity of whirl at outlet),
- $\mathrm{Vf}=\mathrm{Verticalcomponent} \mathrm{ofV} \mathrm{(DC}, \mathrm{equalto).Itis} \mathrm{acomponent} \mathrm{at}$ right angles to the direction of motion of the vane (known as velocity of flow at inlet),
- $\mathrm{V}_{\mathrm{f} 1}=$ Vertical component of V 1 ( EH , equal to). It is a component at right angles tothe direction of motionof the vane (known as velocity of flow at outlet),
- $a=$ Cross sectional area of the jet. As the jet of water enters and leavesthe vanestangentially,therefore shapeofthe vanes will be such that $\mathrm{V}_{\text {r }}$ and $\mathrm{V}_{\mathrm{r} 1}$ will be a long with tangents to the vanes at inlet and outlet.

Therelationsbetweentheinlet andoutlettriangles (untiland unless given) are: (i) $\mathrm{V}=\mathrm{V}_{1}$, and (ii) $\mathrm{V}_{\mathrm{r}}=\mathrm{V}_{\mathrm{r} 1}$ we know that the force of jet, in the direction of motion of the vane,
$F_{x}=$ massofwater striking persecond $x$ change in whirl velocity

$$
\begin{aligned}
& =\rho a(V-u) \times[(V-u)-(-(V-u) \operatorname{COS} \theta)] \\
& =\rho a(V-u) x[(V-u)+(V-u) \operatorname{COS} \theta)] \\
& =\rho a(V-u)^{2} x[1+\operatorname{COS} \theta]

## Shortquestion

## 1.Whatdoyoumeanbyimpactofjet?

Ans -The liquidcomes out in the form of a jet from the outlet of thenozzle fittedinthe outlet ofthe pipe through whichthe liquid is flowing under pressure. ifsome plate, whichmaybe fixed or moving is placed in the path of the jet, a force is exerted by the jet on the plate. This force exerted by the jet on the plate is called impact of jet.

## Longquestions

1. Deriveanexpressionofforce exertedbyajetonstationarycurved plate? 2018(s)
2. A jet of water of diameter 7.5 cm strikes a velocity of $20 \mathrm{~m} / \mathrm{s}$. The curvedplateismovingwithavelocity of $8 \mathrm{~m} /$ sinthedirectionofjet. The jet is deflected through an angle of 165 . Assuming the plate is smooth and find-
(i)forceexertedonplanetinthedirectionofjet.
(ii) powerof jet
(iii) efficiencyofjet2018(s)
3. Water is flowing through a pipe at the end of which a nozzle is fitted. The diameter of nozzle is 120 mm and head of water at the centreofnozzleis 90m.findtheforceexertedbythejetofwateron a fixed vertical plate. Take a coefficient of velocity is given as 0.95 ? 2019(s)
